

Once upon a time, there lived two friends Mario and Luigi. Mario was a developer, so he wanted to surprise Luigi with an application he had been working on for weeks. Eager to share his creation with his friend, he quickly zipped up the source code and sent it over to Luigi via email.

However, in his haste to share the code with Luigi, Mario had overlooked one crucial detail – he had not encrypted the source code before sending it. As the unprotected code traveled through the internet, it attracted the attention of a hacker, who happened to intercept it.

The hacker was determined to exploit this unexpected windfall. He eagerly opened the digital package, only to find that the source code was locked with a mysterious encryption. Frustrated by his inability to unlock the code, he decided to take matters into his own hands.

Convinced that if he couldn't unlock it, the hacker began to break the source code into pieces, so he made sure that no one else could either. The once-coherent code became a chaotic jumble of bits and bytes, scattered like pieces of a digital puzzle.

Meanwhile, Luigi sat down at his computer, eagerly awaiting Mario's surprise. But when he opened the email, he was met with sheer confusion. The source code appeared as if it had been torn apart by a digital tornado, and it made no sense whatsoever.

Frustrated and confused, Luigi knew he needed help. He reached out to the one entity that he believed could make sense of this digital chaos – you, dear reader.

In a desperate message to you, Luigi explained the situation and shared the one piece of information that could potentially unlock this digital mess: the pre-shared key, "Jumpman," that Mario had told him earlier. Luigi promises to give you a reward for helping him solve the mystery.

TLDR; the username is “Jumpman”.
